- Foreword -

TIME, a wonderful concept, one that is difficult to explain, difficult to manage yet with us every day of our lives. At times it speeds by and at times it drags on slowly, however, this year the pace was set by the former.

We at GENIMEX find it difficult to believe that the winter solstice has come and gone and it is now speeding towards the Spring and Summer breeding seasons, for those breeders who mate their cows seasonally. A strange winter so far, with un-seasonable rain in the interior of the country and drought along the southern coast.

Many activities including visits, trips and functions highlighted the calendar of the Genimex Management, Staff and Agents. To mention but a few:

Early January, Anders Anderson of Viking Genetics, our supplier of exceptional Jersey and Holstein genetics visited GENIMEX. The visit proved fruitful in further cementing our business relationship. Viking Genetics was formed when the well-known Dansire merged with the Swedish company Swensk Avel. The strength of the Nordic countries' breeding programme will soon be increased even further when the Finnish breeding programme, FABA is incorporated into VikingGenetics®.

February saw the South African Large Herds Conference take place in Natal, attended by more than 450 delegates and addressed by world class speakers. Genimex together with Livestock Improvement New Zealand were once again proud sponsors of the Conference. We have sponsored every SALHC since its inception in 1997. For this conference we sponsored Mr Chris Glassy from Dairy NZ.

April was again time for the Annual Philadelphia Herd competition held in the Koeberg Western Cape. As the herd competition has grown so has the involvement of Genimex, this year we sponsored the lunch on the first day and we were pleased to serve as many as 70 lunches, an indication of the growing interest in the competition. See page four for details of the continued success of the Genimex product in this competition.

The prize giving dinner after the Ayrshire National Championships held in Bloemfontein was sponsored by Genimex. A fine function hosted by the Ayrshire Society where Mr Kevin Lang was awarded the Ayrshire Gold Cup for a BB Kellogg daughter.

The highlight of the first six months of 2009, without doubt, was the visit to Denmark by 8 prominent Jersey breeders together with 5 Genimex personnel members. WHAT A TRIP, the warm hospitality of our Danish hosts was only surpassed by the quality of animals and genetics that we saw. When Genimex arranges another tour to Denmark in conjunction with VikingGenetics® be sure not to miss it. Many an eye was opened and the rumours spread by the anti-Danish movement, in the cattle breeding industry, were laid to rest as untrue.

The advantages of Genomic Selection and the application thereof have in the last while been much talked about within the cattle breeding fraternity. See page five for a brief explanation of Genomic selection.

During these few hectic months Genimex printed and distributed its first Danish Jersey sire catalogue which has been received well, by breeder and agent alike. Also printed was our annual LIC catalogue. For those who have not received a copy and would like one, please contact the office or the agent in your area. Our expanding market for Ayrshire Sires from the UK prompted the printing of an Ayrshire Sire leaflet. See pages six to nine for the leaflet.

In the last Milk and Honey we posed the question, "When times are tough, what kind of bull's daughters would you like to be milking"? The response from our readers and Genimex agents was conclusive. Whether for pure-breeding, cross-breeding, stud or commercial, the bull should have been one that breeds daughters of average stature, lots of strength, sufficient milk with good components. Longevity and fertility was also not negotiable.

We hope and trust that you all enjoy this, our 4th publication of Milk and Honey.

Chris and Errol.

Anders Andersen, die verkoopsbestuurder van VikingGenetics® besoek Suid-Afrika

Anders Andersen, die
verkoopsbestuurder van
VikingGenetics® besoek Suid Afrika.

Dit is altyd 'n voorreg om ons verskaffers vanuit die buiteland hier in ons pragtige land te ontvang. Dit is nie net 'n voorreg nie maar van belang dat die toestande en behoeftes van ons kliente hier beleef en verstaan word. Tydens Anders se besoek het ons 'n besoek afgelê by die Preekstoel kudde van Tenie Durr naby Malmesburg in die Wes-Kaap.

Die Preekstoel Boerdery

Die Preekstoel kudde het sy ontstaan in 1945 gehad toe oupa Tenie Durr met 'n paar koeie begin het. Pa Wilhelm Durr het die kudde 'n stappie verder geneem deur versekeie skoutoekennings te behaal. Schoongezicht en Fairseat bulle is tot in 1993 gebruik waarna Tenie Durr die kudde van 70 koeie oorgeneem en met KI begin het. Van die eerste Deense bulle plaaslik beskikbaar was o.a. Jas Byg, Fyn Tanic en later Jas Hot, Jas Zorino, Fyn Trac en Jas Funic gebruik. Fyn Lemvig en Jas Zorino het ook 'n groot inpak op die kudde gehad. Daar is tans nog heelwat 8 jaar Lemvig en 10 jaar oud Zorino koeie in die kudde.

Anders Andersen van VikingGenetics® in Denemarke, Roche Cronje die verkoopman van Genimex in die Wes-Kaap en Tenie Durr bespreek die koeie in die Preekstoel Kudde

Tenie het tans 20 Q Zik Dogters in sy kudde wat die volgende prestasie behaal het:

Liggaaom 84	Voete en Bene 86.5	Uier 85	Algeheel 85
1ste Laktasie	5847kg melk	5.52 BV	4.14 prot.
2de Laktasie	6995kg melk	5.52 BV	4.14 prot.

'n Besoek aan die Kaap is nie voltooi sonder om bo op Tafel Berg te staan nie.
Anders Andersen en sy vrou Gurli, Chris Cloete en Johan Muller van Genimex

Teelbeleid

Van die begin af het Tenie aandag gegee aan vaste stowwe en daarvan getuig 'n botteret van 5.2% en 'n proteïen inhoud van 4.2%. Boonop handhaaf die kudde konstant 'n stalgemiddeld van 20 tot 22kg per dag. Daar word veral gefokus op langlewendheid en sodoende word probleemvrye koeie met goeie konsepse wat maklik kalf, geteel. Behalwe die goeie produksie met twee maal per dag melking word 'n uitstekende gemiddelde van 1.5 strooitjies per konsepse behaal.

Teen Desember 2008 het Tenie reeds meer as 500 koeie gemelk. Die sukses van sy teelbeleid word duidelik hiermee weerspieël. Dit het tot gevolg gehad dat hy onlangs die welbekende Schoongezicht kudde kon koop.

Bulle wat tans in die kudde gebruik word is Q-Impuls, Hofborg, Q-Zik (Zorino seun) en DJ May (Lemvig seun). Hy het Denemarke in Junie besoek om sy vertroue in die Deense sisteem te bevestig en toekomstige nuwe bulle te identifiseer.

'n Besondere koei in die Preekstoel kudde

Preekstoel 0443 'n dogter van die dense bull MIRAGE	1 st Laktasie	6934 kg Melk	4.63 BV	3.85 Prot
	2de Laktasie	7050 kg Melk	4.89 BV	4.06 Prot
	3de Laktasie	8188 kg Melk	4.65 BV	3.90 Prot
	4de Laktasie	9051 kg Melk	4.33 BV	3.87 Prot

Tierwil 0587 'n MIRAGE dogter wat aan Mnr WS van der Merwe behoort.

Die Mirage dogter is by die Moreesbrug skou aangewys as Jong Koei en Groot Kampioen.
'n Besondere prestasie. Haar skou prestasie is net so indrukwekkend as haar klassifikasie en produksie rekord.

Veels geluk aan Mnr v.d. Merwe

Liggaaom 98	Voete en Bene 90	Uier 91	Finaal 94
1st Laktasie	7813 kg Melk	4.22 BV	3.56 Prot.
2de Laktasie	9041 kg Melk	4.34 BV	3.69 Prot (Geprojekteer)

A Once A Day (OAD) Milking Experience

Summary of Rob Ballantyne's paper presented at SALHC

The motivation for this trial, which extended from July 2007 to May 2008, was to increase farm profits and use land which was considered too far away from the milking unit.

The herd selected for the trial was a total of 115 first-lactation cows which calved during July, August and up to 10 September 2007. Their breeding was "Black & White" or "Jersey x Black & White". A total of three cows were "lost" during the trial.

The roughage which was supplied to the trial cows was all produced on dry-land pastures. Annual Rye/Perennial Rye and some over-sown into Kikuyu was available from July to November. Mainly kikuyu was available from December 2007 to May 2008.

From Histogram 1 it can be seen that milk yield per cow began at 13.4 litres per cow on average and showed a steady decline to 6 litres per cow in April 2008. It is important to bear in mind that they were all first-lactation cows and being milked only once a day.

Histogram 2 illustrates the increase in butterfat and protein content of the milk of these young cows from August 2007 to April 2008. The slight drop in butterfat percentage during October to December 2007 can be taken as normal because of Summer stress on cows and pastures. The protein content, however, showed a constant monthly increase from about 3.6% to 4.2%. For the record the body mass of the young cows averaged as follows:

September 2007	= 382kg
February 2008	= 402kg
April 2008	= 449kg

With the production of quality milk and the increase in body mass a question arises as to the fertility of the OAD herd.

FERTILITY RESULTS:

The fertility of the OAD herd has been expressed by conception rate after three months of AI/mating and then secondly by the "inter-calving period" between the first and second calving. The results were as follows:

(a) Conception rate:

Since three cows were "lost" from the 115 starters a total of 112 cows were bred. Of these 109 cows were certified in-calf. Only three open cows!

(b) Inter-calving period:

When calved for the second lactation during July/Aug 2008 the average inter-calving period was a mere 354 days.

ECONOMICS

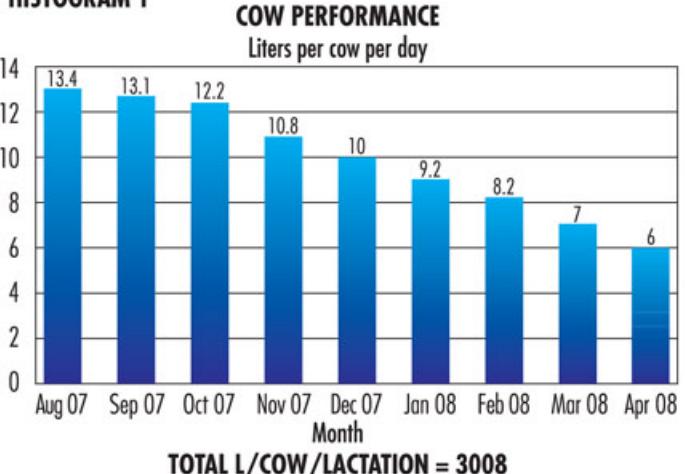

The average income per cow was calculated to be R9993-00. The cost of pasture was R2808 per cow and the cost of concentrates was R1960-00 per cow. The total cost of production was therefore R4768 leaving a margin over feed of R5225 per cow.

CONCLUSION

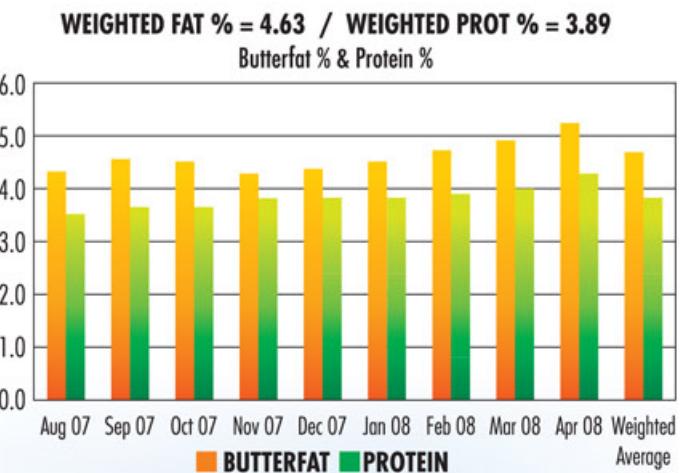

Rob Ballantyne indicated that this very interesting experience was indeed also financially rewarding.

E.L. Dicks

PHILADELPHIA

KUDDE KOMPETISIE

Nageslag van Genimex bulle presteer goed maar slaag net nie daarin om die Dogtergroep klas vir die VYFDE keer na mekaar te wen nie. Veels geluk aan WWS wat die klas met 'n Matt groep gewen het. Genimex kom wel tweede en derde in die klas. Die Genimex prestasie in die klas is besonder goed, vanaf 1999 tot 2009 het nageslag van bulle wat GENIMEX bemark het, 7 uit die 11 keer gewen.

Onsink terug aan bulle soos BORMIO, WOODY, FRUTO STAR, BALANCE en BATMAN. En wie kan van BOS IRON se prestasie in 2008 vergeet toe BOS IRON dogter groep Iste, 2de en 3de geplaas was in die Dogtergroepklas.

Die Algehele wenner van die 2009 Philadelphia Kudde kompetisie was aangewys as die Plaas Drie Susters. Genimex wil graag vir Oom Alfie en Martin Voigt geluk wens met die besonderse prestasie en ook bedank vir hulle ondersteuning en lojaliteit aan Genimex.

Die groep koeie van Drie Susters wen die Eerste Laktasie groepklas. Van links na regs is hulle dogters van BOS IRON, FICTION, LOUNGE, ZARIK en ZARIK.

Die BOS IRON groep van Eensgezind staan derde in die Dogtergroepklas. Van links Danie & Kobus Louw (eienaars) en Roché Cronjé, Genimex agent

Die groep koeie van Drie Susters wen die Tweede Laktasie groepklas. Van links na regs is hulle dogters van TRAILER, BOS IRON, BOS IRON en FARMER

Die BOS IRON groep van Vrymansfontein. Staan tweede in die Dogtergroepklas.

Drie Susters 6214. Junior Kampioen
'n dogter van LOUNGE

At the Genimex / LIC booth during the SA Large Herds Conference

GENIMEX and LIC New Zealand once again sponsored the South African Large herds conference which was held at the Champagne Sports resort in the picturesque Drakensberg. Genimex and LIC have been involved with the SALHC since its inception in 1999 and has sponsored all six of the Large Herds conferences held since then. Genimex and LIC were proud to sponsor one of the speakers, Mr Chris Glassey, a Farms System Specialist, Dairy NZ, Hamilton New Zealand. Chris presented interesting papers on the future of New Zealand farms and Key Performance Indicators for feed use on pastoral dairy farms.

One of the speakers at the conference was the very well known, up front and successful dairy farmer from the Eastern Cape, Mr Rob Ballantyne. Rob's presentation was based on the trials he did on Once A Day Milking, on his farm Lanark in the Tsitsikamma. (See page 3)

From left to right:

Alan Stratford (A well know dairy farmer from Moai River) • Errol Dicks (Director of Genimex)

Hendrik Bezuidenhout (Genimex Salesman in the Eastern Cape)

Phil Wicks (LIC Export manager responsible for South Africa)

Chris Glassey (Speaker from Dairy NZ in New Zealand) at the Genimex / LIC Booth

MILK & HONEY

GENOMIC SELECTION

A term that has been thrown around a lot lately and I felt it important to get to grips with it, as it is here to stay and will have a huge influence on cattle selection in the future. After doing quite a bit of reading about Genomic Selection I have managed to get my head around the topic albeit as a basic summary. References are not given, however are available from chris@genimex.co.za

Cattle have 30 pairs of chromosomes and scientists have developed new technology that identifies the specific patterns of DNA at more than 50 000 locations along these chromosomes. The differences in individuals are based on the differences at each of these and other locations on the chromosomes. The variation at these 50 000 locations across the chromosomes is identified and flagged by single nucleotide changes at these locations. The nucleotide changes present at each of these locations (single nucleotide polymorphisms or SNPs pronounced Snips) can be used to predict how good or bad the genes are that the animal possesses.

The 50 000 locations located on all the chromosomes (among the 3 billion pairs of nucleotides in the DNA of cattle) are sufficient to distinguish the differences between individuals and can be associated with their performance. In large cattle populations the progeny performance data of bulls together with the genotype data of each of the individuals enabled researchers to identify which SNPs affected the estimated breeding value for the economically important traits.

New Zealand has for example genotyped 4500 sires that were progeny tested over the last 30 years. This has enabled the researchers in New Zealand to genotype sires that were the best and the worst of their progeny test cohort and thus evaluate markers across the genetic range. This genotyping has been undertaken on the Illumina 50K SNP panel. In order to validate the data the progeny test BV's were compared with the Genomic BV's estimates for

the relevant sires. The degree of accuracy of the DNA-based BV's was measured by their correlation with progeny test BV's. The correlation varied from 0.45 to 0.60 for production and non-production traits for the Holstein-Friesian Breed.

Up to now there have been three sources of information that can be used in the estimation of BV's:- Parental information, own performance and progeny performance, now we can add DNA information. It is the combination of all four of these sources of information that will lead to more accurate information enabling scientists, AI organisations and breeders to speed up genetic gain in economic important traits.

Consider the advances that can be made in traits like longevity and daughter pregnancy rates because genomic selection increases the reliability for these traits when selecting young sires. We then do not have to wait as long for progeny test data on traits like these to have BV's with acceptable accuracies.

This advance in cattle breeding is quite intimidating and the application and advantages are as yet, I believe, not fully comprehended. We are entering an exciting era where we can use genomic selection to enhance our current selection programmes thereby speeding up genetic gain.

Two of Genimex's suppliers have grasped and developed this technology, with other leading populations. Livestock Improvement Corporation in New Zealand and VikingGenetics® in Denmark have applied the technology and are using it as a selection aid.

SEmen FROM

“The King”

HAS LEFT ROSS TRELEAVEN WITH A SMILE OF SATISFACTION

On 7 June 2004 a young, enthusiastic dairy farmer near Underberg bought 50 units of semen from the New Zealand Holstein/Friesian bull Collins Royal Hugo (commonly known as "The King" in N.Z.). This great bull has an impressive achievement of having no less than 170630 daughters in his proof-data base as published in May 2008. In 2006 Hugo was retired from AI services after having had 1,5 million inseminations recorded in NZ.

Ross presently milks about 500 cows on the farm "Lynton" and a total of 141 units of semen of Hugo were purchased. More would have been purchased but due to high demand the semen stocks of Hugo soon became depleted.

In 2005, during the first "Go Black & White" Underberg Tour, Ross exhibited daughters of Kelvar and Kabul. (Both these bulls are NZ Holstein/Friesian). These young cows were a surprise to many of the visitors because of the body depth, length of body and smaller body frame.

The "2007 Go Black & White" tour had the first daughters of Hugo on exhibition (in the RSA) and these four young cows won the prize of "Best Improvement" for the Lynton herd. These same four cows were again shown as 2nd lactation cows in 2008. Hugo daughters, #5077 (see photo) was admired by many (if not all) and two good daughters in support made the group of three the envy of many. Unfortunately the fourth daughter had been through a tough time and most definitely did not look her best but the good udder, excellent length of body and super legs and feet were clearly present. This group of four daughters of Hugo again collected the prize of "Best Improvement" for the Lynton herd.

Also on view was a daughter of Kilmory which calved at 21 months, without problems.

E.I Dicks

We at Genimex congratulate you, Ross, and thank you for your support. Well done!!

SOUTH AFRICAN JERSEY BREEDERS & GENIMEX AGENTS VISIT *Denmark*

The Danish Jersey Cattle population is certainly one of the largest in the world, at 64 300 milk recorded cows they make up 12.1% of the dairy cattle of Denmark. The average herd size has increased quite dramatically over the last 10 years to an average of 135 cows per herd.

VikingGenetics® was formed when the Danish and Swedish breeding programmes merged. As from January 2010, FABA the Finnish breeding organisation will join VikingGenetics® giving access to a formidable cattle population with very clear breeding goals and objectives.

Currently VikingGenetics® is testing 60 Jersey bulls annually and 31.5% of cows are inseminated to young sire semen. This is one of the many factors that contribute to the Danes having such a reliable progeny testing programme.

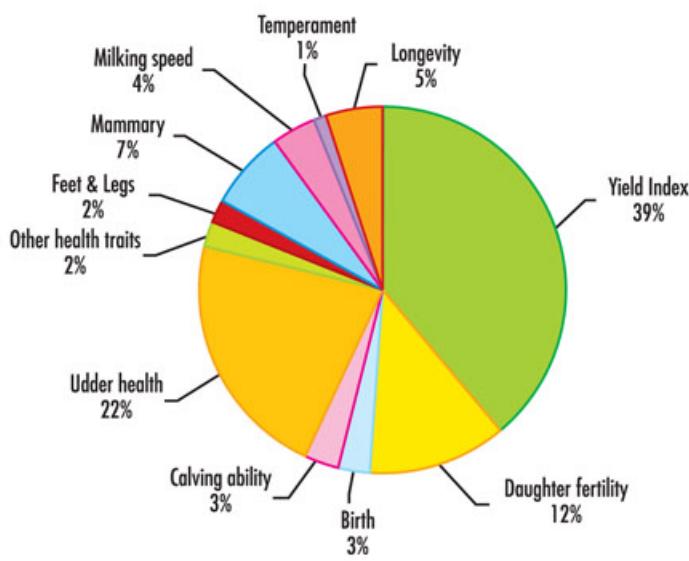

The current production level and the objective for 2020 makes interesting reading.

Production	Actual May 2009	Objective 2020	Production	Actual May 2009	Objective 2020
Milk kg	6550	7600	Protein %	4.05	4.05
Fat %	5.88	5.75	Protein kg	265	310
Fat kg	385	440			

Objectives for 2020 include:

- Teat size. Teats must be 5cm long and 2.5cm in diameter. (Aimed at the increasing numbers of herds using robotic milking systems)
- Somatic Cell count to be below 200 000
- Maximum 0.7 treatments per cow per year. (All treatments are done by the veterinarians and recorded on the data base)
- Retain the long living cow. (Min 3 Lactations per cow)
- Improve Fertility. (Day from 1st to last service)

In October 2008 VikingGenetics® introduced a new Net Merit Index (NTM). This index is calculated by combining various traits that are important to the breeders in the Nordic Countries. The traits that are included in the NTM are also weighted according to their economic values. The pie chart below indicates how the various traits are combined to form the NTM.

VikingGenetics® is also planning to introduce two new traits Locomotion and Hoof diseases into their evaluations. Traits like these can only be included when there is a large and accurate data base to work from with participation from all the role players.

Over the last few years new technologies have been adopted:

Sexed Semen

VikingGenetics® started with sexed semen in 2004 when they moved Impuls and Zik to the UK where sexed semen was produced from them by Cogent. Soon thereafter VikingGenetics® purchased 8 sexing machines which now work 24 hours a day for 5 days a week. Currently VikingGenetics® produce between 1500 and 2000 units per month with a growing demand.

Genomic Selection

VikingGenetics® have embraced this technology and are using it actively to select new bulls to introduce into their testing programme and will soon have young bulls available for sale that were genetically selected. Genomically selected animals will be labelled "GenVik" so that there is clarity when looking at figures of the cows and bulls.

"What makes the Danish Jersey population unique and valuable to any user of Jersey Genetics?"

- Outcross pedigrees
- High Fat and Protein tests (5.88% Fat and 4.06% Prot)
- High production
- High profitability
- Long term selection for animal health traits
- Functional conformation with excellent udders, body capacity and strength.
- A large accurate and well controlled progeny testing programme.

Tienie Durr thanks Steen Pedersen (breeder of Q Zik) for allowing the group to view his excellent Jersey Herd. Tienie has many Q Zik daughters in his herd near Malmesburg and is extremely satisfied with them.
